

Announcing support for iOS crash logs on Sauce simulators

Our product just keeps getting Saucier! Occasionally mobile applications crash during a test and it is hard to identify the root cause of the problem. However, users can now access crash logs generated while testing an iOS application on Sauce iOS simulators. Crash logs contain valuable information like memory usage, call stacks of all the threads at the time of failure and help you debug crashes. Please refer to Apple's documentation on [Crash Reports](#) for more information.

Crash logs for mobile applications are supported on all iOS versions supported on Sauce simulators. Crash logs for a test can be accessed from Logs tab on Sauce Labs Test Details page.
