

Announcing New IPSec VPN for Sauce Labs virtual platforms

We are very excited to announce support for [IPSec VPN](#) on Sauce Labs virtual platforms. IPSec VPN is an industry standard technology to connect two private clouds securely over the Internet. An IPSec VPN tunnel between Sauce Labs and your private network allows Sauce virtual machines to access application servers hosted in your private network. IPSec VPN is an alternative to [Sauce Connect](#). Both solutions provide similar functionality and security. The below table summarizes some of the differences.

-	IPSec VPN	Sauce Connect
Solution	Industry standard	Proprietary
Cost	Paid	Free
Target Customers	Enterprise	All
Supported Sauce Platforms	Virtual platforms - Desktops, Android emulators, iOS simulators	All

To learn more about IPSec VPN please refer to the [documentation](#) or reach out to your Customer Success manager.

Note: Sauce customers with existing VPN connections to Sauce real device or virtual platforms are not impacted by this new feature and can continue using the existing solutions.

Happy testing,
[Chandra Yalangi](#)
