

Setting Up curl/OpenSSL Support for PHP on Windows

Because PHP for Windows doesn't ship with very good SSL support, we recommend setting up OpenSSL.

1. Download and save the attached file [mk-ca-bundle.vbs](#) to your `C:\` directory.
2. Run the file from your command line.

```
C:\>mk-ca-bundle.vbs
```

3. In the `[PHP]` section of the `PHP.ini` file, add this line of code.

```
curl.cainfo = c:\ca-bundle.crt
```

4. Save and close the `PHP.ini` file.
