

# Setting Test Status to Pass or Fail

After you've run your tests, you may notice on your Sauce Labs dashboard that the test status is **Complete**, rather than **Passed/Failed**. On its own, Selenium doesn't have a way to interpret test results, but you can use our API to keep track of passing and failing jobs.

To do so, use the [the update\\_job method in the Sauce Labs REST API](#) after the test has run.

This logic should be part of your Test Automation Framework, so that `update_job` will be called appropriately depending on whether the test passes or fails.

You can find examples for setting pass/fail status in Appium and Selenium tests at [Saucelabs-sample-test-frameworks](#) on GitHub.
