

# Web Application Testing

It's easy to run automated web application tests in the Sauce Labs device cloud:

- Update your test script to include your Sauce Labs credentials and the path to the website for testing as shown in our [Sauce Labs Demonstration Scripts](#)
- Specify the platform / OS / browser combination you want to test your app against
- Establish a [Sauce Connect tunnel](#) if the website you want to test is running on your local machine or behind a firewall

You can use the [Platform Configurator](#) to automatically generate test capabilities. For a full overview of Sauce Labs testing capabilities, refer to the topics in [Test Configuration and Annotation](#).
