

Communication with Sauce Labs over HTTPS Now Available

Return to the [Product Announcements and Release Notes Blog](#)

You can now use HTTPS in your Selenium and Appium scripts to communicate with the Sauce Labs browser cloud. All of our sample scripts in the [Sauce Labs Sample Scripts](#) and [Sauce Labs Sample Framework Scripts](#) GitHub repos have been updated to use HTTPS. You should update your own testing scripts as well to have the highest level of security for your communications with the Sauce Labs browser cloud. The exception is testing scripts that have been written in Python. The Selenium client bindings for Python do not support HTTPS. This is a known issue, which is being tracked [in the Selenium issue tracker](#) if you want more information, or to contribute to resolving this issue.
