

# Sauce Labs Basics

It's easy to get your Selenium and Appium tests up and running with Sauce through a few basic steps. For more detailed information, you can check out the topics under [Web Application Testing](#) and [Mobile Application Testing](#).

## Before Running Your Test

- You need to have set up a [Sauce Labs account](#)
- You should have an existing [Selenium](#) or [Appium](#) test that you want to run on Sauce.  
**NOTE:** If you've never written a Selenium test script you should read the topic [Getting Started with Selenium for Automated Website Testing](#). If you don't have an existing Selenium or Appium script, you can clone and run one of the example scripts from our [Sauce Labs Demonstration Scripts](#) repo in GitHub.
- The website you want to test must be accessible over the Internet for our browsers to be able to reach it.
- If you want to [test a native mobile application](#), the application must be in [Sauce Storage](#) or [another location](#) where our emulators and simulators can connect to it.
- If the website or application you want to test is behind a firewall or on localhost, you need to set up a secure [Sauce Connect Proxy](#) tunnel for us to connect to it.

## Setting Up Your Test

1. Set up your test to connect to the Sauce Labs browser cloud using your account credentials.  
The exact configuration depends on the language you're using in your script. The scripts in [Sauce Labs Demonstration Scripts](#) include examples in various languages that walk through setting up your authentication credentials and specifying the path to the Sauce Labs cloud.
2. Use the [Platform Configurator](#) to specify [the Desired Capabilities of your test](#).  
Desired Capabilities are the mechanism in Selenium and Appium that lets you specify the combination of platform, operating system, and browser that you want to use in your website tests. You can find out more about using Desired Capabilities in the topics under [Test Configuration and Annotation](#), as well as in the [Selenium](#) and [Appium](#) documentation. You can also check out some [Examples of Test Configuration Options for Automated Website Tests](#) and [Examples of Test Configuration Options for Mobile Application Tests](#).
3. Make sure your test is set up to report results to the Sauce Labs application.  
On its own, Selenium only knows if a test has completed or not. If you want more information, like whether the website passed or failed the test, you need to set up reporting to the Sauce Labs application. As with the case of setting up your authentication credentials, the exact reporting configuration depends on the language you're using in your test script. The scripts in [Example Selenium Scripts for Automated Web App Tests](#) include examples of how to enable reporting for each language. You can also use the [Sauce Labs REST API](#) to annotate your tests after they have completed, including pass/fail status.

## Running Your Test

1. Log in to Sauce Labs.

You don't need to be logged in to run your test, but if you are you can watch your test run and the results appear in the Test Results page in Sauce Labs.

2. On your local machine, run your test script.

That's it! As your test script executes you'll see the results are displayed.

## After Running Your Test

Now that you've run your first test with Sauce, you're ready to explore more advanced functionality!

- You can [run multiple tests in parallel](#) to accelerate your development pipeline
- You can [integrate your tests on Sauce Labs with Jenkins, Bamboo, and other continuous integration/continuous delivery servers](#)
- You can [add more team members to your account](#) so they can run tests with Sauce too
